Regional Informational Report¹ No. 3A98-04

February 1998

¹The Regional Information Report Series was established in 1987 to provide an information access system for all unpublished divisional reports. These reports frequently serve diverse ad hoc informational purposes or archive basic uninterpreted data. To accommodate timely reporting of recently collected information, reports in this series undergo only limited internal review and may contain preliminary data; this information may be subsequently finalized and published in the formal literature. Consequently, these reports should not be cited without prior approval of the author or the Commercial Fisheries Management and Development Division.

OFFICE OF EQUAL OPPORTUNITY (OEO) STATEMENT

The Alaska Department of Fish and Game conducts all programs and activities free from discrimination on the basis of sex, color, race, religion, national origin, age, marital status, pregnancy, parenthood or disability. For information on alternative formats available for this and other department publications, please contact the department ADA Coordinator at (voice) 907-465-4120, (TDD) 1-800-478-3648, or (fax) 907-586-6596. Any person who believes s/he has been discriminated against should write to: ADF&G, P.O. Box 25526, Juneau, AK 99802-5526; or O.E.O., U.S. Department of Interior, Washington, DC 20240.

INTRODUCTION

The Kwiniuk River drains into Norton Sound just east of the village of Moses Point, approximately 100 miles east of Nome. The Kwiniuk and Tubutulik Rivers are the primary tributaries for salmon spawning in the Moses Point Subdistrict. In 1962 commercial salmon fishing began in the Moses Point Subdistrict. The last significant chum salmon commercial harvest occurred in 1988 (Bue and Lean 1997).

Since 1965 a salmon counting tower has been operated on the Kwiniuk River (Lean 1994, and Rob 1996a, 1996b and 1997). The project operates as a means to obtain timely and accurate escapement information that is required to actively manage the stocks throughout the season.

OBJECTIVES

1. Obtain daily and seasonal estimates of the timing and magnitude of the salmon escapement by species to the Kwiniuk River.
2. Collect age, sex, and length composition samples from the chum salmon escapement to the Kwiniuk River.

METHODS

The Kwiniuk River tower camp is approximately 4 miles upstream from the mouth of the river, on land leased to the Alaska Department of Fish & Game (ADF&G) by Hans Jemewouk of Moses Point (Figure 1).

The crew began working on 13 June, 1997. After inventorying equipment and purchasing supplies in Nome, they ferried equipment by air to Moses Point and by boat to the tower site. The camp was set up and radio communication with Nome established.

A 50 foot vinyl canvas flash panel placed on the river bottom provided a contrasting background where fish species could easily be identified. The flash panel covered approximately half the width of the river. The shore end of the flash panel was placed next to the cut bank on the camp side of the river. An aircraft cable threaded through grommets along the upstream edge of the flash panel was staked at each end to hold the panel in place. Sandbags placed at intervals along the cable edge of the panel held it down on the stream bottom to prevent fish from moving under the panel.

A 20 foot high aluminum scaffold was assembled on the bank directly in line with the flash panel and about three feet from the edge of the river. The scaffold was used as a tower from which fish were observed and enumerated as they passed over the flash panel. The tower was guyed by aircraft cables tied off to stakes in the ground. Planks were used as footings and sandbags placed on boards set across the lowest rungs of the scaffolding provided a low center of gravity and stability.

A weir was built from the midstream end of the flash panel to the shore opposite the tower. The weir ensured that all fish passed over the flash panel. The weir was built of steel pipe posts, aluminum angle stringers and aluminum conduit pickets.

A 12 volt lighting system was installed to illuminate the flash panel during dark periods. These lights were powered by an automotive battery that was recharged using a portable generator.

The counting schedule began at 0000 hours on 18 June. The three person crew counted 18 half-hour counts from 1200 hours each day to 0600 hours the following day except for days off and days of 24 hour counts. Mondays were the normal day off. On the day following the day off, the crew counted 24 half-hour counts from midnight to midnight the following day. The daily counts considered in this report ran from midnight to midnight the following day.

The counts for each half hour shift were doubled to estimate hourly counts for each species. Each day the estimated hourly counts were added to produce a daily total. The daily and cumulative totals for each species were relayed to the Nome office by radio.

The expanded counts for this report were calculated as follows. The 18 hour counts for the day off were estimated by adding the hourly counts of the day before to the hourly counts of the day following and dividing the result by two, giving expanded hourly counts for 18 hours of the day off. Next an expansion factor was calculated to compensate for the 6 hours not normally counted. This factor was derived from the weekly 24 hour count by dividing the total count from 0600 hours to 1200 hours during the 24 hour count by the total normal 18 hour count during the 24 hour count. The expansion factor was applied to data from the three days before and after each 24 hour count by multiplying each days 18 hour total by the 24 hour expansion factor, and adding that number to the 18 hour count for each day. This expansion was done for all species counted.

Scales were taken, lengths measured, and sex identified from chum and king salmon that were collected by beach seine from the Kwiniuk River.

RESULTS

Table 1 shows the expanded daily and cumulative totals for each salmon species. The expanded counts were: 20,118 chum salmon, 9,536 pink salmon, and 972 king salmon (Tables 2-4). The reported total hourly counts were: 16,504 chum salmon, 8,292 pink salmon and 762 king salmon (Appendix Tables 6-8). Figures 2-7 show graphs of the expanded daily totals and the cumulative expanded daily totals for each species counted. No coho salmon were observed during the 1997 counting season.

Counting began on 18 June. King salmon were observed on the first day of counting, chum salmon were observed on the second day and pink salmon were first observed on 30 June. The daily peak of 1,864 chum salmon occurred on 4 July, the daily peak of 3,136 pink salmon occurred on 23 July, and the daily peak of 126 king salmon occurred on 3 July (Table 1).

All species counted exhibited a diurnal pattern of migration past the counting tower. The greatest hourly chum salmon migration occurred during the hour from midnight to 0100, when 12.6% passed the tower. During the twelve hour period from 1500 through 0200 hours, 85% of the chum salmon passed the tower. The least upstream migration of chum salmon occurred during the hour period from 1200 to 1300 hours (Table 2 and Figure 8). The greatest hourly pink salmon upstream migration occurred during the hour from 1100 to midnight hours, when 16.3% passed the tower. During the five hour period from 2000 through 0200 hours, 71% of the pink salmon passed the tower. The least upstream migration of pink salmon occurred during the hour periods from 1200 to 1400 hours, and from 1500 to 1600 hours when 0.1% passed the tower (Table 3 and Figure 9). The diurnal pattern of king salmon migration was not as pronounced. The greatest hourly king salmon migration occurred during the hour from 0100 to 0200 hours, when 9.4% passed the tower. The second greatest hourly king salmon migration occurred from 1400 through 1500 hours, when 7.6% passed the tower (Table 4 and Figure 10).

A total of 433 usable chum salmon samples were collected on 7 days during the period from 4 - 24 July, 1997. The age, sex and mean length composition of the samples sorted by sampling date and age/sex category is presented in Table 5. Analysis of the chum salmon scale samples showed that 4.8% of the fish sampled were age-0.2, 50.3% were age-0.3, 43.6% were age-0.4, 0.9% were age-0.5 and 0.2% were age-0.6 (Table 6). The sex and age composition of the total 1997 chum salmon escapement was not estimated because the first third of the escapement was not sampled.

Climatological and stream observations are shown in Table 7.

DISCUSSION

The Kwiniuk River tower project has operated since 1965. The project ran well this year and provided timely escapement information that was useful for inseason fisheries management. The Kwiniuk River counting tower was the only escapement project operating in the Moses Point subdistrict during 1997.

The escapement of chum salmon in 1997 was slightly above the tower goal and 25% less than the average chum salmon tower count since 1965 (Figure 11). The first 70% of the chum salmon escapement was two to three days earlier than the normal year timing model and the last 30% was two to three days later than the normal year timing (Figures 12 and 13). The escapement of pink salmon was 95% less than the odd year average since 1982 (Figure 14). The first 80% of the pink salmon escapement was about three to five days behind the odd year pink salmon run-timing model. The rest of the pink salmon escapement was about one day ahead of the odd year pink salmon run-timing model (Figure 15). The escapement of king salmon was 45% above the average since 1981 (Figure 16). King salmon timing was ahead of the king salmon run-timing model all season (Figure 17).

River conditions this year were fair to excellent for the entire season. Water levels and conditions did not adversely impact fish observation (Table 8).

ACKNOWLEDGEMENTS

The crewleader for the season was Larry Neff. Joel Saccheus, and James Katongan were crewmembers. A draft of this report was reviewed by Larry Buklis.

^a Although no counts were made from 6/19-6/27, crew notes indicate that few salmon passed during this period.

^b The last daily count was dropped because it resulted in a net decrease in escapement, probably caused by downstream movement of post-spawning salmon.

^c Counts for 6/27-6/28 estimated from the 1965-1993 "Normal" run-timing model. This year was excluded from the computation of mean run-timing models.

^d Reported counts are observed 18-hour counts expanded by 2.1%, based upon a comparison of 18-hour and 24-hour counts made from 1965 to 1969.

^d Reported counts are observed 18-hour counts expanded by 2.1%, based upon a comparison of 18-hour and 24-hour counts made from 1965 to 1969.

^e Some missed counts were estimated. This footnote taken from the tower report. Estimation details not known.

^f Counts prior to 7/4 estimated from 1963-1993 "Early" run-timing model. This year was excluded from the computation of the mean run-timing models.

^g Reported counts are observed 18-hour counts expanded by weekly 24-hour counts.

^a Although no counts were made from 6/19-6/27, crew notes indicate that few salmon passed during this period.

^b Counts for 6/27-6/28 estimated from the 1965-1992 "Normal" run-timing curve. This year was excluded from the computation of the "Normal" run-timing curve.

^c First days count is an aerial survey count

Appendix Table 3. Kwiniuk River counting tower chum salmon run-timing models, percent passage by day, Norton Sound, 1965-1997.

The run-timing expressed in numbers of chum reflects the tower passage goal of 19,500 chum salmon established in 1992.
